AIR HANDLING

Knock-Down Unit Construction

When access is the issue

Knock-Down is the way to go!

Retrofit and renovation projects can present unique challenges. Buffalo Air Handling can provide a factory designed, engineered, fabricated and tested air handling unit (AHU) for knock-down (KD) construction to meet your space and access restrictions while insuring specified performance is achieved.

KD construction can be provided in one of two ways:

- With the AHU shipped in sections and minimally fastened, so that the contractor may disassemble it, take it into place in pieces and reassemble it in place
- With the AHU completely knocked down in the factory and palletized for shipment, as shown to the left

Either way you get the benefits of:

- Factory assembly to assure proper fit-up of components
- Laser leveling system in the factory to assure sections are square
- Full perimeter angles at the shipping splits
- Match marked pieces and sections
- 3D drawings and assembly instructions
- Factory installation supervision
